

# VIRTUAL EXAM ROOM

Connecting Patients with Physicians

## FEATURES

- Connects patients and clinicians anytime, anywhere, using HIPAA compliant, secure video conferencing
- Clinicians collect vital sign and cardiopulmonary data in real-time from remote patients
- Seamlessly syncs data with an EMR

## REQUIREMENTS

- IDM100 integrated medical tablet for patient access
- Chrome browser and personal computer for Care Central access
- Care Central connectivity using Dictum Health cloud or DLM (Dictum Link Manager) software on a private server

Virtual Exam Room (VER) uses the IDM100 with video conferencing technology to connect providers with patients anytime, anywhere. Like an actual exam room, the VER is completely private using the same clinically accurate medical equipment, while providing secure real-time access to physicians. With the VER, patients can see a clinician, stream diagnostic data, and share medical images.

## HOW IT WORKS

Patients join the VER using the IDM100's integrated video, while physicians join through the Care Central Portal on their own computer or laptop. Care Central establishes the patient video conferencing session, while providing important patient information, such as medical history, conditions and medications, and diagnostic images.

The result is an unprecedented level of access and care, enabling healthcare providers to reach patients anytime, anywhere, while sharing real-time diagnostic and monitoring data and syncing it to the EMR.
